***Election/Restrictions***

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-6, drawn to a method of suppressing gene expression in an eukaryotic cell via a co-suppressive sense sequence expression construct, classified in class 435, subclass 375.
- II. Claims 7-15, drawn to a method of suppressing gene expression in an eukaryotic cell via an antisense expression construct, classified in class 435, subclass 375.
- III. Claims 16-26, drawn to a recombinant vector that comprises at least one sense nucleotide sequence and cells which genome comprise such a vector, classified in class 435, subclass 320.1.
- IV. Claims 16-20 and 27-40, drawn to a recombinant vector that comprises at least one antisense sequence and cells which genome comprises such a vector, classified in class 435, subclass 320.1.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions are different methods that use materially different compounds that function by different mechanisms. The method of Group I utilizes a sense sequence that inhibits gene expression via a co-suppressive

Art Unit: 1635

mechanism and the method of Group II utilizes a compound that inhibits gene expression via an antisense mechanism, for example.

Inventions III and IV are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions have different compositions that have different compositions (structure/sequence) that function via different mechanisms. The composition of group III, for example comprises a sense sequence that will not inhibit a gene sequence via an antisense mechanism since the sequence is by definition a sense sequence. The antisense sequence of the vector of group IV would not suppress gene expression the way a sense sequence does since the sequence is, for example, antisense. Furthermore, the independent claim 16 is an improper Markush type claim since the members of the group do not share both a common utility and a substantial structural feature disclosed as being essential to that utility (see MPEP 803.02, for example).

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

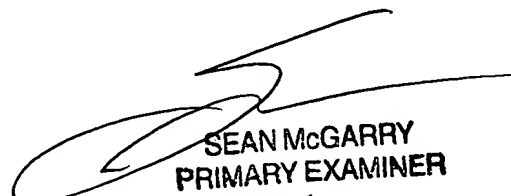

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).
